

Shekel AI Agents Marketplace Proof of Concept

Document Version: 1.0 | Date: April 3, 2026 | Status: Draft

1. Executive Summary

Shekel is a decentralized AI agent marketplace where developers, creators, and businesses can build, list, discover, and monetize AI-powered agents. The platform enables anyone to deploy specialized AI agents that perform tasks autonomously — from generating social media content to drafting architectural 3D house plans — and allows other users to access these agents on a pay-per-use or subscription basis. Shekel introduces a transparent commission model, composable agent architecture, and a developer ecosystem designed to accelerate AI utility across industries.

2. Platform Overview & Purpose

Shekel solves a fundamental challenge in the AI ecosystem: discoverability and monetization of specialized AI agents. While large general-purpose models exist, there is a growing demand for task-specific agents that understand niche workflows — real estate, marketing, legal, design, finance, and more. The Shekel marketplace functions as an App Store for AI agents. Builders create and publish agents tailored to specific tasks; users browse, subscribe, or pay per task to use them. The platform handles authentication, payments, API routing, and usage analytics — so developers focus on building great agents and users focus on getting work done.

Core Objectives

- Democratize access to specialized AI capabilities for individuals and businesses of all sizes.
- Provide a fair and transparent revenue-sharing model for agent developers.
- Enable composability — allowing agents to be stacked and extended on top of each other.
- Foster a community-driven ecosystem of verified, high-quality AI agents.
- Ensure trust, accountability, and security through built-in review and audit mechanisms.

3. How Agents Are Listed & Used

3.1 Agent Listing Process (For Developers)

Any developer or team can submit an agent to the Shekel marketplace by following a structured onboarding process:

Step 1 — Build: Develop the agent using any framework (LangChain, AutoGen, custom APIs, etc.) and expose it via a standardized Shekel Agent API interface.

Step 2 — Register: Submit the agent via the Shekel Developer Portal, providing a name, description, category, input/output schema, pricing model, and example prompts.

Step 3 — Review: Shekel's automated testing suite runs quality, safety, and performance checks. Agents failing tests are returned with feedback for improvement.

Step 4 — Publish: Approved agents appear in the marketplace with a dedicated profile page, including demo runs, user reviews, average response time, and usage stats.

Step 5 — Maintain: Developers can update agents, push new versions, and respond to user feedback. SLAs are monitored by the platform.

3.2 Agent Discovery & Usage (For Users)

Users access Shekel through a web app, mobile app, or API. The marketplace features a search engine with filters by category, price range, rating, task type, and input modality (text, image, audio, file).

Once a user selects an agent, they can:

- Run a free demo (limited usage) to test agent output quality.
- Subscribe to a monthly plan for unlimited or high-volume access.
- Pay per task/call for low-frequency or one-off needs.
- Integrate via API for programmatic access in their own products.
- Chain with other agents by using the Shekel Workflow Builder (drag-and-drop interface).

4. Payment & Commission Structure

Shekel's monetization framework is designed to be simple, transparent, and fair for both developers and users. The platform supports multiple pricing models and collects a platform commission to fund operations and infrastructure.

4.1 Pricing Models Available to Developers

Pay-Per-Use: Users are charged a fixed fee per task or API call. Ideal for one-off or low-frequency needs. Example: \$0.10 per social media post generated.

Subscription (Monthly/Annual): Users pay a recurring fee for a set number of tasks or unlimited usage. Ideal for power users or businesses with predictable volumes. Example: \$29/month for 500 tasks.

Freemium: Agent is free for a limited number of tasks per month, with paid tiers unlocking higher limits or premium features. This model maximizes discoverability.

Enterprise / Custom Pricing: For high-volume enterprise clients, developers can offer custom SLA agreements and bulk pricing, negotiated directly through the Shekel Enterprise portal.

4.2 Commission Structure

Shekel retains a platform commission from each transaction to cover hosting, security, payment processing, and marketplace operations. The structure is tiered based on agent revenue:

- Tier 1 (First \$1,000/month revenue): Shekel takes 20%, developer earns 80%.
- Tier 2 (\$1,001 – \$10,000/month revenue): Shekel takes 15%, developer earns 85%.
- Tier 3 (Above \$10,000/month revenue): Shekel takes 10%, developer earns 90%.

Payouts are processed bi-weekly directly to developer bank accounts or crypto wallets. All transactions are logged on a transparent earnings dashboard accessible to each developer.

4.3 Payment Gateway & Currencies

Shekel supports payments via:

- Credit/Debit cards (Visa, Mastercard, Amex) via Stripe
- PayPal and Apple Pay / Google Pay
- Cryptocurrency (ETH, USDC, BTC) for Web3-native users
- Invoice billing for enterprise customers

5. Agent Use Case Examples

The following are illustrative examples of agents that can be listed and used on the Shekel marketplace. These span creative, professional, and technical domains.

Use Case 1: Social Media Content Generator

Agent Name: SocialCraft AI

Purpose: Generates platform-specific social media posts (Instagram, X/Twitter, LinkedIn, TikTok) from a brief input or URL.

How It Works: User provides a topic, brand tone, and target audience. The agent crafts captions, hashtags, CTAs, and even suggests image descriptions or video scripts optimized for engagement.

Pricing: \$0.05 per post or \$15/month for 500 posts.

Who Uses It: Social media managers, brand teams, influencers, small business owners.

Use Case 2: 3D House Plan Generator

Agent Name: ArchitectAI

Purpose: Generates 3D floor plans and architectural renderings from natural language descriptions or rough sketches.

How It Works: User describes the number of rooms, style (modern, colonial, minimalist), lot dimensions, and special requirements (home office, pool, open kitchen). The agent produces detailed 2D/3D floor plans, elevation views, and a materials list.

Pricing: \$2.50 per plan or \$99/month for unlimited drafts.

Who Uses It: Real estate developers, homeowners, interior designers, architects for early-stage ideation.

Use Case 3: Legal Contract Reviewer

Agent Name: LexAI

Purpose: Reviews legal contracts, flags risky clauses, summarizes terms in plain English, and suggests revisions.

How It Works: User uploads a contract (PDF or DOCX). The agent identifies non-standard clauses, liability risks, missing protections, and provides a plain-English summary with a risk score.

Pricing: \$1.00 per contract or \$49/month for up to 100 contracts.

Who Uses It: Startups, freelancers, small businesses, law firms for preliminary review.

Use Case 4: E-Commerce Product Description Writer

Agent Name: ShopScribe

Purpose: Writes SEO-optimized product descriptions for e-commerce stores in bulk.

How It Works: User inputs product name, category, key features, and target market. ShopScribe produces descriptions in multiple formats (short, long, bullet-point) optimized for Amazon, Shopify, WooCommerce, or custom storefronts.

Pricing: \$0.03 per product description or \$20/month for 1,000 descriptions.
Who Uses It: Online retailers, dropshippers, brand managers.

Use Case 5: Customer Support Automation Agent

Agent Name: SupportBot Pro

Purpose: Handles common customer support queries, drafts replies, and escalates complex issues to human agents.

How It Works: Integrates with help desk tools (Zendesk, Intercom, Freshdesk). Uses a company's knowledge base to answer FAQs, track order status, process return requests, and generate tickets for unresolved issues.

Pricing: \$49/month per connected inbox or custom enterprise pricing.

Who Uses It: E-commerce brands, SaaS companies, service businesses.

6. Building on Existing Agents (Composability & Extension)

One of Shekel's most powerful features is its composable agent architecture. Rather than every developer starting from scratch, Shekel allows agents to be built on top of other agents — creating powerful, layered workflows without duplicating effort.

6.1 Agent Inheritance & Extension

Developers can fork and extend public agents with the original developer's permission. The extended agent inherits base functionality and adds new behaviors, customizations, or domain-specific knowledge. Revenue is automatically split between the original agent developer and the extension developer based on a pre-agreed ratio set at the time of forking (e.g., 30% base / 70% extension).

Example: A developer takes the base SocialCraft AI agent and extends it with a fashion-niche layer — training it on fashion terminology, seasonal trends, and influencer tone. The result is SocialCraft Fashion, a specialized agent for clothing brands, built on top of SocialCraft AI.

6.2 Agent Chaining via Workflows

Users and developers can chain multiple agents together using the Shekel Workflow Builder. Workflows allow the output of one agent to become the input of another, enabling complex multi-step automation with no coding required.

Example Workflow — Real Estate Marketing Pipeline:

1. ArchitectAI generates a 3D floor plan from property specs.
2. ShopScribe (adapted for real estate) writes a property listing description.
3. SocialCraft AI creates targeted social media posts for the listing.
4. SupportBot Pro handles inbound inquiries from potential buyers.

This end-to-end workflow replaces hours of manual work with a few clicks, powered entirely by agents sourced from the Shekel marketplace.

6.3 The Shekel Agent SDK

Shekel provides a developer SDK (available in Python, JavaScript, and REST) with:

- Pre-built connectors to popular AI models (OpenAI, Anthropic, Gemini, Mistral).
- Agent memory and context management modules.
- Tools for calling other Shekel agents as sub-agents within a workflow.
- Rate-limiting, logging, and error-handling built in.
- A local sandbox environment for testing before publishing.

7. Trust, Safety & Quality Control

Shekel is committed to maintaining a high-quality, trustworthy ecosystem. Every agent on the platform goes through rigorous quality controls before and after publication.

7.1 Pre-Publication Review

- Automated quality benchmarking against sample inputs/outputs.
- Safety screening for harmful, biased, or misleading outputs.
- Latency and reliability stress testing.
- Code and API security audit.
- Compliance checks for GDPR, CCPA, and data handling policies.

7.2 Post-Publication Monitoring

- Real-time monitoring of uptime, error rates, and response times.
- User reviews and ratings (1–5 stars) with verified usage requirements.
- Automated flagging of agents with sudden quality drops or policy violations.
- Community reporting system for inappropriate or broken agent behavior.
- Quarterly developer scorecards with performance and user satisfaction metrics.

8. Roadmap & Next Steps

The following roadmap outlines the planned development phases for the Shekel AI Agents Marketplace:

Phase 1 — Foundation (Months 1–3):

- Launch core marketplace with basic agent listing and discovery.
- Integrate payment processing (Stripe + crypto).
- Release SDK v1.0 for developers.
- Onboard 50 seed agents across 10 categories.

Phase 2 — Growth (Months 4–6):

- Launch Workflow Builder (no-code agent chaining).
- Enable agent forking and extension revenue splits.
- Introduce Developer Dashboard with earnings analytics.
- Open Beta for public user registration.

Phase 3 — Scale (Months 7–12):

- Enterprise tier launch with custom SLAs.
- Agent verification badges (Verified, Featured, Top-Rated).
- Mobile app launch (iOS & Android).
- Global marketplace expansion with multi-language support.
- Third-party integrations (Zapier, Slack, Notion, Salesforce).

9. Conclusion

Shekel is positioned to become the definitive marketplace for AI agents, bridging the gap between powerful AI capabilities and real-world business needs. By enabling developers to monetize their work, users to access specialized agents at competitive prices, and both parties to build on top of each other's innovations, Shekel creates a compounding flywheel of value.

This proof of concept establishes the foundational framework for the platform. The next step is to validate the core assumptions through a closed beta with selected developers and early-adopter businesses, gather feedback, and iterate rapidly toward a full public launch.
